# Supplementary Notes: (PJ Shlachtman, Miller book) Energy Efficiency and Renewable Energy Resources

## What is Energy Efficiency?

- 84% of all commercial energy in used in the US is wasted
- Energy efficiency the percentage of total energy input that does useful work
- Life cycle cost the initial cost plus lifetime operating costs
- The net efficiency of the entire energy delivery process is determined by the efficiency of each step in the energy conversion process.
- The 3 least energy efficient using devices are incandescent light bulbs, vehicles w/ internal combustion engines, and nuclear power plants producing electricity for space heating.

### Why it is important to reduce energy waste

- 1. make nonrenewable fossil fuels last longer
- 2. gives us more time to phase in renewable energy resources
- 3. decreases dependence on oil imports
- 4. lessens need for military intervention in the oil-rich and politically unstable Middle East
- 5. Reduces local and global environmental damage
- 6. Is the cheapest and quickest way to slow projected global warming
- 7. Saves more money, provides more jobs, improves productivity and promotes more economic growth per unit of energy than other alternatives.
- 8. Improves competitiveness in the international marketplace.

The reason there is not more emphasis on improving energy efficiency is the glut of low-cost underpriced fossil fuels.

A second cause is huge government subsidies

### Ways to Improve Energy Efficiency

#### How can we use waste heat?

- Energy cannot be recycled
- For a house: insulate it, eliminate air leaks and equip it with an air-to-air heat exchanger

### How can we save energy in industry?

#### Cogeneration

- production of two useful forms of energy from the same fuel source.
- Efficiency can be increased to approx. 90%

Replacing energy-wasting electric motors; use adjustable-speed drives

### How can we save energy in producing electricity? The Negawatt Revolution

The negawatt revolution is known as demand-side management - reducing demand for electricity

## How can we save energy in Transportation?

- 1. Increase the fuel efficiency of motor vehicles
  - There is little interest in fuel-efficient vehicles when gasoline is so cheap
- 2. Electric cars
  - pollution to recharge batteries is produced elsewhere
  - Electric cars are not very efficient
- 3. Shift to more energy efficient way to move people and freight

### How can we save energy in buildings?

- Superinsulated houses; air-to-air heat exchangers
- Use the most energy-efficient ways to heat houses: passive solar heating and high-efficiency natural gas furnaces. [electric resistance heating is the most wasteful]
- Heat pumps work in warm climates
- For existing homes add insulation, plug leaks and install energy saving windows
- Use the most energy-efficient ways to heat water (using electricity is the least efficient)
- Use the most energy-efficient appliances and lights
- Rebates or tax credits for building energy-efficient buildings, etc.

Direct use of solar energy for heat and electricity

### The Renewable Energy Age

Using Solar Energy to Heat Houses and Water

- Passive Solar Heating
  - captures sunlight directly within a structure and converts it into low-temperature heat for space heating
  - o Thermal mass stores collected energy as heat and releases it day and night
- Active Solar Heating special collectors absorb solar energy; a fan or pump is used to circulate the hot water
- Net energy yield is moderate; CO<sub>2</sub> not emitted; land distrubance is minimal
- Owners need solar legal rights

#### How Can Solar Energy Be Used to Generate High-Temperature Heat and Electricity?

- 1. Central Receiver System (Power Tower)
- 2. Heliostats computer controlled mirrors
- 3. Solar Thermal Plant (distributed receiver system)
- 4. Parabolic dish collectors
- 5. Nonimaging optical solar concentrator
- 6. Solar cookers

### Producing Electricity from Solar Cells - The PV Revolution

Photovoltaic Cells (Solar Cells) - Sunlight falling on a wafer thin silicon sheet releases a flow of electrons creating an electric current.

High net energy yield; works in cloudy weather.

Cost of PVs is high;

Storage of electricity produced is a problem

• Batteries are expensive Flywheels are promising

#### Producing Electricity from Moving Water and from Heat in Stored Water

Hydroelectric Power

- Large-scale hydroelectric project (large dam)
- Small-scale hydroelectric project a low dam with no reservoir
- Pumped storage hydropower systems water reservoirs at two different levels
- Moderate to high net energy yield
- Flood vast areas, destroy wildlife habitat, uproots people, ...

Producing electricity from Tides and Waves

• Few suitable sites and construction costs are high

Producing electricity from heat stored in water

- OTEC (Ocean thermal energy conversion)
- Saline solar ponds
- Freshwater solar ponds

### Producing electricity from Wind

- Unlimited source at favorable sites
- Land underneath turbines can be used for grazing cattle or farming
- Need steady winds

## Producing Energy from Biomass

- Organic matter can be burned directly as a solid fuel, or converted into gaseous or liquid biofuels.
- Potentially renewable if managed properly.
- Biogas (60% methane, 40% CO<sub>2</sub>); liquid methanol; liquid ethanol
- Biomass Plantations of Btu Bushes: burned directly or converted to alternative fuels
- Requires large areas of land
- Burning Wood
  - o contains pollutants known to cause cancer, bronchitis, emphysema
  - Need efficient wood-burning stoves
- Burning agricultural or urban wastes
  - o Bagasse residue left after harvesting and processing sugar cane.

### Solar Hydrogen Revolution

Water can be split by electricity into  $H_2$  and  $O_2$ .

#### Geothermal Energy

#### Sustainable Energy Strategy

- improved energy efficiency
- chose projects carefully
- we cannot continue to depend on a single nonrenewable energy source.

#### What the government can do

- increase fuel efficiency standards for motor vehicles
- establish energy-efficiency standards for buildings and appliances
- increase government sponsored R&D to improve energy efficiency
- give tax credits and exemptions for purchases of energy efficient vehicles, houses, buildings and appliances
- phase in full-cost pricing to include the environmental impact
